

Jump Start® Grow Tube Height Selection

Choosing the right grow tube height for your vineyard will optimize the performance of the grow tube and the vine. Refer to the chart below to choose the Jump Start grow tube that's right for you. For optimal performance the top of the grow tube should be at least 6 inches below the first cordon (fruiting) wire to allow plenty of room to train the vine in a gentle arc to the wire without causing any sharp angles in the stem. Sharp angles can cause weak points in the stem and inhibit future vine growth. The chart illustrates the optimal grow tube height for cordon or fruiting wires up to 42 inches high. For taller trellis systems like those with a high-wire, single cordon up to a height of 72 inches, we would recommend the maximum 36-inch grow tube height.
